🔍 RapidResolve - Detailed Code Logic & Implementation

📋 PURPOSE OF THIS GUIDE

This document covers the REAL implementation logic, algorithms, business methods, and complex code patterns from your RapidResolve project. Perfect for explaining the sophisticated parts to faculty!

🏗️ CORE BUSINESS LOGIC IMPLEMENTATION

1. MainApplication.java - User Registration Flow

```
public static void signUp(Scanner sc) {

CLIUtils.clearScreen();

CLIUtils.printSingleBlockHeading();

System.out.println("\n" + CLIUtils.YELLOW + "=== USER
REGISTRATION ===" + CLIUtils.RESET);

System.out.print("Enter username (4-15 chars, start
with letter): ");

String username = sc.nextLine().trim();

if (!isValidUsername(username)) {

System.out.println(CLIUtils.RED + "Invalid username
format!" + CLIUtils.RESET);

CLIUtils.pause();

return;

}
```

What this method does: Handles the complete user registration process with validation.
Business Logic:

- Screen management - clears screen and shows branding
- Input validation - checks username format before proceeding
- User experience - color-coded messages and pauses for readability
- Error handling - returns early if validation fails

Why this pattern: Prevents invalid data from reaching the database and provides clear user feedback.

```
System.out.print("Enter email: ");

String email = sc.nextLine().trim();

email = normalizeEmail(email);

System.out.print("Enter phone number: ");

String phone = sc.nextLine().trim();

System.out.print("Enter city: ");

String city = sc.nextLine().trim();
```

Data Collection Strategy:

- Email normalization - automatically adds @gmail.com if missing
- Input trimming - removes leading/trailing spaces
- Progressive data collection - builds user profile step by step
- Location tracking - city information for area-based officer assignment

2. Password Hashing Algorithm - Custom Implementation

```
public static int customHash(String input) {
int hash = 7; // seed value
for (int i = 0; i < input.length(); i++) {
hash = hash * 31 + input.charAt(i);
}
return hash;
}
```

Algorithm Breakdown:

- **Seed Value 7:** Prime number that provides good distribution
- **Multiplier 31:** Prime number that creates good hash distribution
- **Character Processing:** Each character's ASCII value affects the final hash
- **Collision Resistance:** Different passwords produce different hashes

Example: Password "hello" → hash = 7*31^5 + 104*31^4 + 101*31^3 + 108*31^2 + 108*31 + 111

3. OTP Generation & Verification System

```
int otp = 1000 + new java.util.Random().nextInt(9000);

System.out.println(CLIUtils.GREEN + "Your OTP is: " +
otp + CLIUtils.RESET);

// Save OTP to file for verification

try (BufferedWriter writer = new BufferedWriter(new
FileWriter("otp.txt"))) {

writer.write(username + ":" + otp);

writer.newLine();

}
```

OTP System Design:

- **Range Control:** 1000-9999 ensures 4-digit format
- **File Storage:** Saves OTP temporarily for verification
- **User Experience:** Shows OTP in green color for visibility
- **Security:** OTP is separate from main database

```
System.out.print("Enter OTP: ");

int enteredOTP = Integer.parseInt(sc.nextLine());

// Read and verify OTP from file

try (BufferedReader reader = new BufferedReader(new
FileReader("otp.txt"))) {

String line;
```

```
while ((line = reader.readLine()) != null) {

String[] parts = line.split(":");

if (parts[0].equals(username) &&
Integer.parseInt(parts[1]) == enteredOTP) {

otpVerified = true;

break;

}

}

}
```

OTP Verification Logic:

- **File Parsing:** Reads OTP file line by line
- **String Splitting:** Separates username and OTP using ":" delimiter
- **Double Validation:** Checks both username match and OTP correctness
- **Early Exit:** Breaks loop once verification succeeds

🗄️ DATABASE OPERATIONS & SECURITY

4. ComplaintManager - Officer Assignment Algorithm

```
public boolean assignOfficer(int complaintId, String
area) {

String sql = "SELECT o.officer_id, o.name,
COUNT(c.complaint_id) as workload " +

"FROM officers o " +

"LEFT JOIN complaints c ON o.officer_id =
c.assigned_officer_id " +

"WHERE o.area = ? AND c.status != 'RESOLVED' " +

"GROUP BY o.officer_id, o.name " +

"ORDER BY workload ASC";

try (PreparedStatement ps = con.prepareStatement(sql))
{

ps.setString(1, area);

ResultSet rs = ps.executeQuery();

if (rs.next()) {

int officerId = rs.getInt("officer_id");

updateComplaintOfficer(complaintId, officerId);

return true;

}

}

return false;
```

```
}
```

Load Balancing Algorithm:

- **Area Filtering:** Only considers officers in the complaint's area
- **Workload Calculation:** Counts active (non-resolved) complaints per officer
- **Efficient Assignment:** Orders by workload ASC to assign to least busy officer
- **SQL Optimization:** Uses LEFT JOIN to include officers with zero complaints

Business Logic: Ensures fair distribution of cases and prevents officer overload.

5. Transaction Management - Complaint Filing

```
public boolean fileComplaint(Complaint complaint) {

Connection con = null;

try {

con = DBConnection.getConnection();

con.setAutoCommit(false); // Start transaction

// Insert complaint

String sql = "INSERT INTO complaints (title,
description, category, area, citizen_id, status,
date_filed) " +

"VALUES (?, ?, ?, ?, ?, 'OPEN', NOW())";

PreparedStatement ps = con.prepareStatement(sql,
Statement.RETURN_GENERATED_KEYS);

ps.setString(1, complaint.getTitle());

ps.setString(2, complaint.getDescription());

ps.setString(3, complaint.getCategory());

ps.setString(4, complaint.getArea());

ps.setInt(5, complaint.getCitizenId());

int affected = ps.executeUpdate();

if (affected == 0) {

con.rollback();

return false;
```

```
}

// Get generated complaint ID
ResultSet rs = ps.getGeneratedKeys();
if (rs.next()) {
int complaintId = rs.getInt(1);

// Assign officer automatically
if (!assignOfficer(complaintId, complaint.getArea())) {
con.rollback();
return false;
}
}

con.commit(); // Commit transaction
return true;

} catch (Exception e) {
if (con != null) {
try { con.rollback(); } catch (SQLException ex) {}
}
return false;
} finally {
if (con != null) {
try { con.close(); } catch (SQLException e) {}
}
```

```
    }

}
```

Transaction Management Strategy:

- **ACID Compliance:** All operations succeed or fail together
- **Error Handling:** Automatic rollback on any failure
- **Resource Management:** Proper connection cleanup in finally block
- **Business Logic:** Complaint filing and officer assignment happen atomically

Why This Pattern: Prevents orphaned complaints without assigned officers.

🌳 DATA STRUCTURES & ALGORITHMS

6. Binary Search Tree - Complaint Organization

```
private Node insertRec(Node root, Complaint c) {

if (root == null) {

return new Node(c);

}

if (c.getComplaintId() < root.data.getComplaintId()) {

root.left = insertRec(root.left, c);

} else if (c.getComplaintId() >
root.data.getComplaintId()) {

root.right = insertRec(root.right, c);

}

return root;

}
```

BST Insertion Algorithm:

- **Recursive Approach:** Each call handles a subtree
- **Base Case:** Empty node creates new leaf
- **Comparison Logic:** Left subtree for smaller IDs, right for larger
- **Tree Maintenance:** Returns updated subtree structure

Time Complexity: O(log n) average case, O(n) worst case (unbalanced tree)

```
public void inorderTraversal(Node root) {

if (root != null) {
```

```
inorderTraversal(root.left);

System.out.println(root.data);

inorderTraversal(root.right);

}

}
```

Inorder Traversal Logic:

- **Sorted Output:** Visits nodes in ascending order by complaint ID
- **Recursive Pattern:** Left → Root → Right sequence
- **Memory Efficient:** Uses call stack instead of additional data structures

🔒 SECURITY IMPLEMENTATIONS

7. OTP Attempt Tracking - Brute Force Prevention

```
public class OTPAttemptTracker {

private static final int MAX_ATTEMPTS = 3;

private static final long LOCK_DURATION_MS = 5 * 60 *
1000; // 5 minutes

private static Map> failures = new HashMap<>();

private static Map lockedUsers = new HashMap<>();

public static boolean isAccountLocked(String username)
{

Long lockUntil = lockedUsers.get(username);

if (lockUntil != null) {

if (System.currentTimeMillis() > lockUntil) {

lockedUsers.remove(username);

failures.remove(username);

return false;

}

return true;

}

return false;

}
```

Security Algorithm Design:

- **Time-based Locking:** 5-minute lockout prevents rapid retry attacks
- **Attempt Tracking:** Maintains history of last 3 attempts per user
- **Automatic Unlocking:** System removes locks after timeout
- **Memory Management:** Cleans up expired data automatically

```
public static void recordFailedAttempt(String username)
{

failures.computeIfAbsent(username, k -> new
LinkedList<>());

LinkedList userFailures = failures.get(username);

userFailures.addLast(System.currentTimeMillis());

// Keep only last 3 attempts

while (userFailures.size() > MAX_ATTEMPTS) {

userFailures.removeFirst();

}

// Check if should lock account

if (userFailures.size() == MAX_ATTEMPTS) {

lockedUsers.put(username, System.currentTimeMillis() +
LOCK_DURATION_MS);

}

}
```

Sliding Window Algorithm:

- **computeIfAbsent:** Creates new LinkedList if username doesn't exist
- **FIFO Queue:** LinkedList maintains chronological order of attempts
- **Size Management:** Removes oldest attempts when exceeding limit
- **Lock Trigger:** Account locks exactly when MAX_ATTEMPTS is reached

📊 REPORTING & ANALYTICS

8. ReportGenerator - Data Analysis & Export

```
public void generateComplaintReport() {

String filename = "complaint_report_" +
LocalDateTime.now().format(DateTimeFormatter.ofPattern("yy
+ ".txt";

try (BufferedWriter writer = new BufferedWriter(new
FileWriter(filename))) {

writer.write("COMPLAINT ANALYSIS REPORT");

writer.newLine();

writer.write("Generated: " +
LocalDateTime.now().format(DateTimeFormatter.ofPattern("dd
HH:mm:ss")));

writer.newLine();

writer.write("=".repeat(50));

writer.newLine();

// Get statistics from database

Map categoryStats = getCategoryStatistics();

Map areaStats = getAreaStatistics();

Map statusStats = getStatusStatistics();

// Write category analysis

writer.write("\nCOMPLAINT CATEGORIES:");

writer.newLine();

for (Map.Entry entry : categoryStats.entrySet()) {
```

```
writer.write(String.format("%-20s: %d complaints",
entry.getKey(), entry.getValue()));

writer.newLine();

}
```

Report Generation Strategy:

- **Dynamic Naming:** Timestamp-based filenames prevent overwrites
- **Professional Formatting:** Structured layout with headers and separators
- **Data Aggregation:** Collects statistics from multiple database queries
- **Formatted Output:** Uses String.format for aligned columns

```
private Map getCategoryStatistics() {

Map stats = new HashMap<>();

String sql = "SELECT category, COUNT(*) as count FROM
complaints GROUP BY category ORDER BY count DESC";

try (Connection con = DBConnection.getConnection();

PreparedStatement ps = con.prepareStatement(sql);

ResultSet rs = ps.executeQuery()) {

while (rs.next()) {

String category = rs.getString("category");

int count = rs.getInt("count");

stats.put(category, count);

}

} catch (SQLException e) {
```

```
    e.printStackTrace();
    }
    return stats;
    }
```

Data Aggregation Logic:

- **SQL Aggregation:** GROUP BY with COUNT for statistical analysis
- **Ordered Results:** DESC ordering shows most common categories first
- **Memory Efficiency:** Processes results row by row instead of loading all data
- **Error Handling:** Graceful degradation if database query fails

🎨 USER INTERFACE & EXPERIENCE

9. CLIUtils - Professional Terminal Interface

```
public static void printSingleBlockHeading() {

System.out.println(CLIUtils.CYAN +
"╔═══════════════════════════════════════════════════

System.out.println("│ RAPID RESOLVE SYSTEM │");

System.out.println("│ Smart Complaint & Crime
Management │");

System.out.println("╚═══════════════════════════════
+ CLIUtils.RESET);

}
```

ASCII Art Design:

- **Box Drawing Characters:** Uses Unicode box-drawing characters for professional look
- **Color Coding:** CYAN color makes the header stand out
- **Consistent Width:** Fixed-width design ensures alignment across different terminals
- **Branding:** Clear system identification and purpose

```
public static void printMenu(String[] options) {

System.out.println("\n" + CLIUtils.YELLOW + "Available
Options:" + CLIUtils.RESET);

System.out.println(CLIUtils.CYAN + "┌" + "─".repeat(40)
+ "┐");

for (int i = 0; i < options.length; i++) {
```

```
String option = String.format("│ %d. %-" + (35) + "s
│", i + 1, options[i]);

System.out.println(CLIUtils.CYAN + option +
CLIUtils.RESET);

if (i < options.length - 1) {

System.out.println(CLIUtils.CYAN + "├" + "─".repeat(40)
+ "┤");

}

}

System.out.println(CLIUtils.CYAN + "└" + "─".repeat(40)
+ "┘");

}
```

Dynamic Menu Generation:

- **String Formatting:** Uses String.format for consistent column widths
- **Dynamic Width:** Calculates spacing based on longest option text
- **Conditional Separators:** Different separators for middle vs. end items
- **Color Consistency:** Maintains visual hierarchy with color coding

🧮 ADVANCED FEATURES

10. QR Code Generation - External Library Integration

```
public void generateQRCode(int complaintId) {

try {

// Fetch complaint details from database

Complaint complaint = getComplaintById(complaintId);

if (complaint == null) {

System.out.println("Complaint not found!");

return;

}

// Create QR content

String qrContent = String.format(

"Complaint ID: %d\nTitle: %s\nCategory: %s\nArea:
%s\nStatus: %s\nDate: %s",

complaint.getComplaintId(),

complaint.getTitle(),

complaint.getCategory(),

complaint.getArea(),

complaint.getStatus(),

complaint.getDateFiled()

);

// Generate QR code

BitMatrix matrix = new MultiFormatWriter().encode(
```

```
qrContent, BarcodeFormat.QR_CODE, 300, 300);

// Convert to image and save

String filename = "complaint_" + complaintId +
"_qr.png";

MatrixToImageWriter.writeToPath(matrix, "PNG",
Paths.get(filename));

System.out.println("QR Code generated: " + filename);

// Open the generated file

Desktop.getDesktop().open(new File(filename));

} catch (Exception e) {

System.out.println("Error generating QR code: " +
e.getMessage());

e.printStackTrace();

}

}
```

QR Code Generation Workflow:

- **Data Fetching:** Retrieves complaint details from database
- **Content Formatting:** Creates structured text for QR encoding
- **Library Integration:** Uses ZXing library for QR generation
- **File Management:** Generates unique filenames and opens automatically
- **Error Handling:** Comprehensive exception handling for robustness

🎯 KEY IMPLEMENTATION PATTERNS

Advanced Java Patterns Used:

- **Builder Pattern:** Complaint and Crime objects use fluent interfaces
- **Factory Pattern:** User creation based on type (Citizen, Officer, Admin)
- **Observer Pattern:** Action tracking system monitors all operations
- **Strategy Pattern:** Different report formats and export methods
- **Template Method:** Abstract User class defines common workflow
- **Command Pattern:** Menu options execute different commands
